

Analysis of RS92-RS41 twin soundings available in GRUAN database

Alessandro Fassò - University of Bergamo, Italy

ICM11 - Singapore, 22 May 2019

At ICM-10 I compared RS92-GDP & RS41-EDT1 showing

1. How to use GDP measurement uncertainty in statistical analysis
2. The role of vertical correlation and solar radiation
3. Inter-instrument/inter-processing bias assessment using heteroskedastic local polynomial least squares.
4. Bias adjustment and harmonisation

RS41-EDT.1 vs RS92-EDT.1

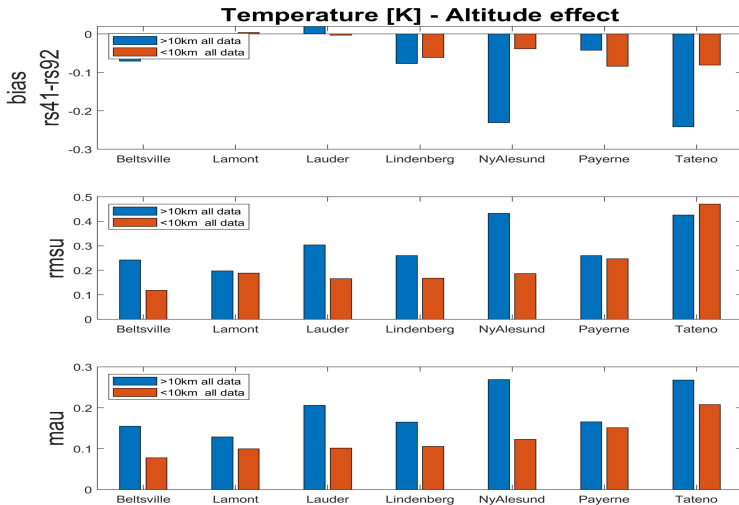

| Site | | Twin launches | | | |
|------|------------|---------------|-------|----------|----------|
| | | ALL | Night | Outliers | Update |
| BEL | Beltsville | 105 | 49 | 3 | 02/03/19 |
| SGP | Lamont | 19 | 7 | 1 | 08/06/14 |
| LAU | Lauder | 53 | | 2 | 17/11/16 |
| LIN | Lindenberg | 388 | 146 | 12 | 07/05/19 |
| NYA | NyAlesund | 120 | 16 | 4 | 27/03/18 |
| PAY | Payerne | 107 | 54 | 3 | 12/12/17 |
| TAT | Tateno | 10 | 5 | | 16/10/17 |

RIVAL are coming ...

Temperature - Nighttime effect

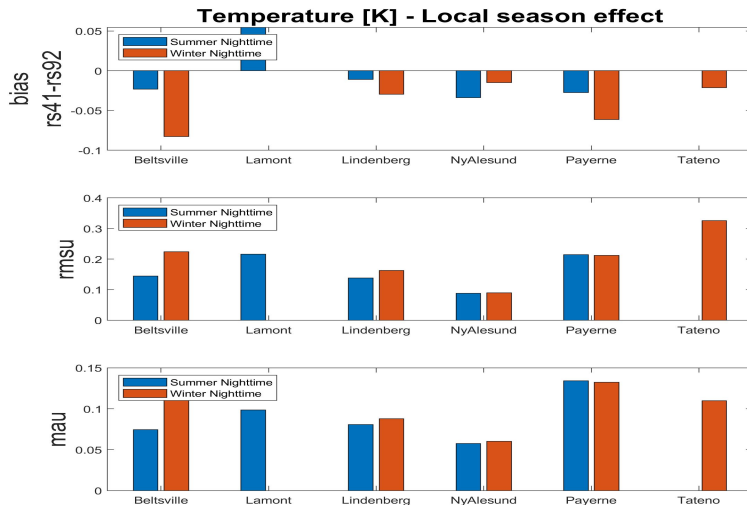

Temperature - Altitude effect (all data)

Temperature - Altitude effect (Nighttime data)

Temperature - Season effect (Nighttime data)

Humidity - Nighttime effect

Humidity - Altitude effect (alldata)

Humidity - Altitude effect (Nighttime)

Humidity - Season effect

Altitude: quality & uncertainty

$$alt(RS41) - alt(RS92) @ LIN$$

All profiles

alt & temp uncertainty

Sincronisation

Start time difference:

$$\text{avg} \cong -2\text{s}$$

(except 4 profiles $> 400\text{sec}$)

Sincronisation

Start time difference:
 $\text{avg} \cong -2\text{s}$
(except 4 profiles $> 400\text{sec}$)

temperature crosscorrelation
max at $\text{lag} = 0$
for all profiles

RMSU and outlier profiles

Vert RMSU BEL d.temp, ncol=108, th= 97

Vert RMSU SGP d.temp, ncol= 20, th= 97

Vert RMSU LAU d.temp, ncol= 55, th= 97

Vert RMSU LIN d.temp, ncol=400, th= 97

Vert RMSU NYA d.temp, ncol=124, th= 97

Vert RMSU PAY d.temp, ncol=110, th= 97

Temperature - Solar effect

Temperature - Nighttime

Humidity - Solar effect

Humidity - Nighttime

Conclusions & further actions (1/2)

1. Both Nighttime results and solar effect seem to be quite stable for both T & q.

Conclusions & further actions (1/2)

1. Both Nighttime results and solar effect seem to be quite stable for both T & q.
2. Temperature:
generally, RS41 is warmer especially daytime (measurable solar effect)
Total uncertainty: $RMSU \cong 0.1 - .2K$

Conclusions & further actions (1/2)

1. Both Nighttime results and solar effect seem to be quite stable for both T & q.
2. Temperature:
generally, RS41 is warmer especially daytime (measurable solar effect)
Total uncertainty: $RMSU \cong 0.1 - .2K$
3. Humidity:
generally, RS41 is wetter (0.005 – 0.01)
Total uncertainty: $RMSU \cong 0.01 - .02$

Conclusions & further actions (1/2)

1. Both Nighttime results and solar effect seem to be quite stable for both T & q.
2. Temperature:
generally, RS41 is warmer especially daytime (measurable solar effect)
Total uncertainty: $RMSU \cong 0.1 - .2K$
3. Humidity:
generally, RS41 is wetter (0.005 – 0.01)
Total uncertainty: $RMSU \cong 0.01 - .02$
4. Above uncertainties could be overestimated due to
ALTITUDE UNCERTAINTY
 \Rightarrow In general, RS41 is higher than RS92
 \Rightarrow but this deserves more attention.
